**①** Push-Pull or SSI output can only be ordered with 10-30V DC power supply.

**②** Not available with push-pull and SSI output. Output logic inverted.

**③** SSI available with Gray Code output only.

**④** SSI only available with 12-pin connector.

**⑤** Excess 76 used for 9 bit 360 gray code. BCD is 10 bit.

① Latch control not available with Gray Code or SSI output. On Gray Code encoders this pin is not connected (N/C).

② Important—The Direction pin function provides Direction Control for Binary Coded Decimal and Natural Binary or MSBC for parallel Gray Code. See next page for further detail.

### Direction Pin

The Direction Pin can change function with code type. In parallel type Gray Code encoders, its function is Most Significant Bit Complement or MSBC for short. In Natural Binary, Binary Coded Decimal and Gray Code SSI encoders, its function is Direction Control.

### Direction Control ①

#### Natural Binary and BCD

A logic "1" (+DC or open) on the direction control pin will produce increasing counts with a counter-clockwise rotation of the shaft. A logic "0" (DC common) on the direction control pin will produce increasing counts with a clockwise rotation of the shaft.

#### Gray Code (SSI)

A logic "1" (+DC or open) on the direction control pin will produce increasing counts with a clockwise rotation of the shaft. A logic "0" (DC common) on the direction control pin will produce increasing counts with a counterclockwise rotation of the shaft.

#### Gray Code (parallel)

Counterclockwise rotation of the shaft will produce increasing counts. For increasing counts with a clockwise rotation, use the Most Significant Bit Complement Pin instead of the Most Significant Bit Pin. See Electrical Connection table for pin designation.

**ATTENTION:** For parallel gray code: connecting the MSB or MSBC to +DC will result in permanent damage to the encoder.

### Reset Pin

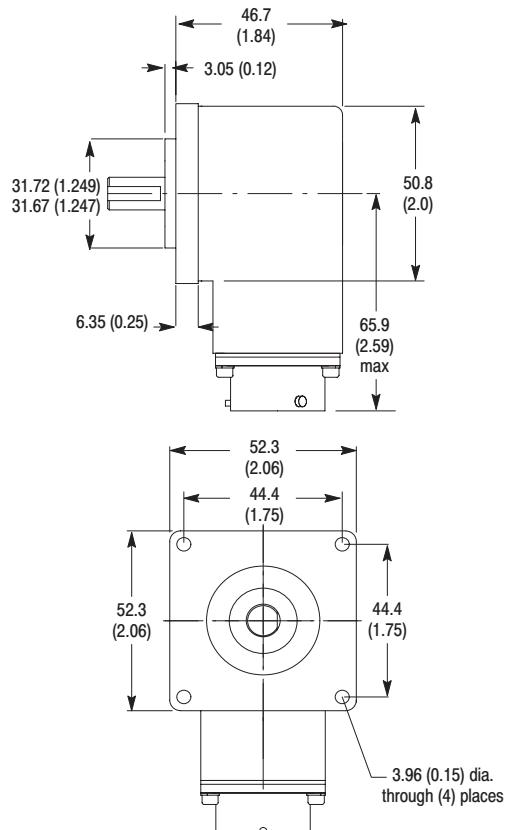

The shaft must be stationary before using the reset function. Connecting the Reset Pin to +DC will reset Natural Binary and BCD position value to zero. Connecting the Reset Pin to +DC will reset Gray Code position value to maximum (e.g., 255, 511, 1023, etc.) if MSBC is used, to zero if MSB is used. The reset function requires a connection to +DC for 0.1 seconds or longer.

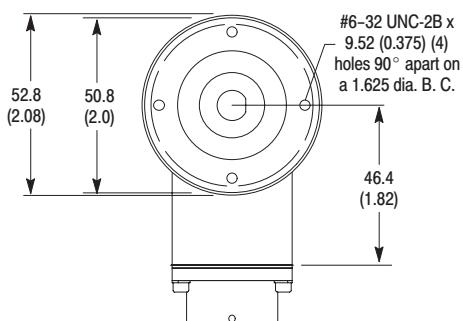

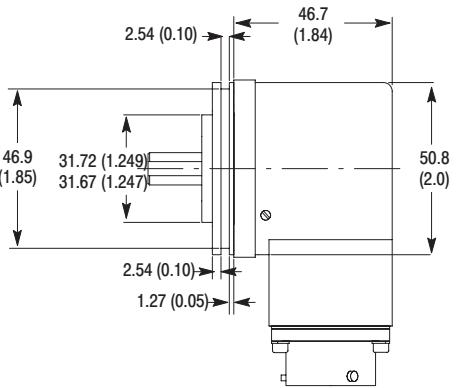

**ATTENTION:** Activating the Reset Pin results in a change of position reading. This can cause unexpected motion which could result in damage to the product, equipment, or personal injury.

① Rotation is viewed from the end of the encoder shaft.
